

DSP techniques for implementation of perfectly matched layer for truncating FDTD domains

[O. Ramadan](#); [A.Y. Oztoprak](#)

Abstract:

A new algorithm for implementing the perfectly matched layer (PML) using digital signal processing (DSP) is presented for truncating finite difference time-domain (FDTD) domains. The algorithm is based on incorporating digital filtering techniques into the PML formulation. A simple, unsplit-field and material independent PML formulation is achieved.
