PROGRAM INFORMATION

General Goal of the Program	Our Software Engineering program aims to graduate highly skilled and knowledgeable professionals with hands-on experience who can be

Program Learning Outcomes	1. Apply foundational knowledge in mathematics, science, and computing to analyze and solve complex software engineering problems.
	2. Integrate and evaluate software requirements and system models using appropriate analysis techniques to support reliable and effective software design.
	3. Design and develop software architectures and systems that satisfy functional and non-functional requirements, considering security, performance, and maintainability.
	4. Implement and test software solutions using modern programming languages, tools, and quality assurance methods to ensure robustness and correctness.
	5. Select and utilize industry-standard tools and techniques, including version control, continuous integration, and DevOps practices, in the software development lifecycle.
	6. Assess and interpret the ethical, legal, professional, and societal implications of software engineering solutions, including sustainability, data privacy, and intellectual property.
	7. Work independently and collaborate effectively in multidisciplinary teams, demonstrating leadership, responsibility, and teamwork in software projects.
	8. Communicate effectively with peers and stakeholders through professional documentation, reports, presentations, and clear software interfaces.
	9. Plan, manage, and execute software engineering projects, incorporating risk analysis, cost estimation, and standard project-management methodologies.
	10. Engage in autonomous lifelong learning and professional growth by staying current with emerging technologies and continuing education opportunities.

Course Breakdown

COURSE DESCRIPTIONS

Course Descriptions – I: All Area Core and Faculty/School Core courses offered by the department of the program.

Course Code	Course Title	Credit	Credit	Catego.	Pre-requisite	Teaching Language
ENGR101	Information Technology and Applications	(2, 0, 1)2	2	FC	-	English
Course Content	This course aims to introduce all students to the basic concepts of information technology and to train them in the skills needed to use office productivity tools. Course subjects include; History of Computing, Fundamental Hardware descriptions and functions, Software types and functions, Numbering Systems and Binary, Input, Output and Storage devices, Internet and the World Wide Web, Understanding Networks, Privacy while using Computers, Computer and Software Crimes and Security, Computer Ethics, Cloud Computing fundamentals. The course also covers the usage of Microsoft Word, PowerPoint, and Excel.					
ENGR103	COMPUTER PROGRAMMING-I	(2, 0, 2)3	5	FC	-	English
Course Content	The Computer Programming course introduces students to the concept of programming including designing algorithms and writing pseudo-code to solve engineering-related problems, creating flowcharts to represent the steps of a problem solution, and the basic elements of the Python programming language the implement their solution. The course covers common high-level programming concepts such as Data types, constants and variables, arithmetic and logical operators, decision-making expressions. Fundamental components of Python included in the course are; storing and manipulating input data, design and use of selection structures, repetition structures, various data structures such as lists, dictionaries and sets, functions, and modular design.					
MATH121	CALCULUS-I	(3, 2, 0)4	6	FC	-	English
Course Content	Calculus-I covers differential and integral calculus, with applications in geometry, physics, and engineering. Students will learn to apply calculus concepts to various scientific and engineering applications. Topics include identifying function types, graphing functions, evaluating limits, handling elementary functions (polynomial, trigonometric, logarithmic, exponential, etc.), solving undefined limits, and evaluating derivatives. Derivatives of elementary functions, product, and quotient rules will be covered, along with applications of derivatives. Integration topics include evaluating integrals, defining integrals, and using methods like substitution, integration by parts, and integrating rational functions. The course will also explore the practical applications of integration.					
MATH123	DISCRETE MATHEMATICS	(3, 1, 0)3	5	FC	-	English
Course Content	Discrete mathematics is the first non-calculus course for mathematics, computer science, and engineering majors. This course introduces the mathematical tools and techniques used to study discrete processes as opposed to continuous processes. Topics covered include discrete concepts such as basic set theory, functions, relations, recurrences, counting principles, the fundamentals of propositional logic and Boolean algebra, graphs, and trees. The course also introduces proof techniques in mathematics, including proof by induction, proof by truth table, proof by Venn diagram, etc. This course is indeed a prerequisite for logic design, operational research, combinatorics, abstract algebra, mathematical modeling, geometry, and topology courses.					
PHYS121	PHYSICS-I	(3, 1, 1)4	5	FC	-	English
Course Content	The aim of the course is to provide the basic information in order to help the students to understand the possible complicated problems in engineering. In this regard, the basic principles and methods of solving the problems in physics are taught. The course provides a basic grounding in elementary physics including mechanics. The basic subjects of the course are: Units and dimensions uniformly accelerated motion in one dimension, Freefall, Vector mathematics, Two-dimensional motion, Newton's laws of motion, Applications of Newton's laws, Free body diagrams, Circular Motion, Work and energy, Conservation of energy, Momentum, impulse, and collisions, Rotational kinematics, Torque, Static equilibrium. For completeness, the students are supposed to do 6 experiments related to the subjects of the course.					
ENGR104	COMPUTER PROGRAMMING II	(2, 0, 2)3	4	FC	ENGR103	English
Course Content	Review of the C programming language. Structured and modular programming using C. Local and global variables. Structured programming constructs. Arrays and array handling. Multi-dimensional arrays. Structures and Unions. Arrays of structures. Defining new data types in C. Functions in C. Call-by-value and call-by-reference. Character and string functions. Scope and extent. Recursion. Pointers and pointer arithmetic. Dynamic memory allocation and simple data structures in C. Arrays of pointers. Bit manipulation. Files; data and file processing. Conditional compilation and exception handling in C.					
MATH122	CALCULUS-II	(3, 2, 0)4	6	FC	MATH121	English
Course Content	This calculus course covers differential and integral calculus with applications in geometry, physics, and engineering. Topics include sequences and infinite series, convergence tests, absolute and conditional convergence, power series, Taylor and Maclaurin series, and radius of convergence. It also covers parametric equations and polar coordinates, graphing polar equations, area in polar coordinates, arc length, and derivative of polar equations. Vectors and vector-valued functions, dot and cross products, lines, and planes are explored. Additionally, the course covers functions of several variables, domain, limits, partial derivatives, and definite integrals over regions.					
MATH124	LINEAR ALGEBRA	(3, 1, 0)3	5	FC	-	English
Course Content	The aim of this course is to introduce the basic operations in linear algebra and applications in engineering problems; matrices, matrix properties, and matrix operations: Addition, scalar multiplication, multiplication, transpose, solution of system of linear equations: Elimination method, Gauss Jordan forms, inverse method to solve linear systems, row reduced echelon forms, Gaussian elimination method, inverse, and determinants: solving linear equations with determinant (Cramer's rule), use one row to evaluate determinant, minor, cofactor, adjoin matrix, identity matrix, square matrix of the matrices. Real vector spaces, vectors and their properties and applications in engineering: Addition, subtractions, dot product, scalar multiplication, cross product, basis, dimensions, and subspaces.					
PHYS122	Physics-II	(3, 1,1)4	5	FC	PHYS121	English
Course Content	This course provides the basic information to help the students to understand the possible complicated problems in engineering. The subjects of the course are mostly Electricity and Magnetism. The basic subjects of the course are Properties of electric charges, Coulomb's law, and Electric field of continuous charge distribution, Gauss's law, and electric flux. Application of Gauss's law to charged insulators, Obtaining the value of the electric field from the electric potential, Electric potential and the potential energy due to point charges, Electric potential due to continuous charge distributions, Electric current, Resistance and Ohm's law, Electromotive force, Resistors in series and in parallel. Kirchhoff's rules.					
CMPE215	ALGORITHMS AND DATA STRUCTURES	(3, 0, 1)3	6	AC	ENGR104	English
Course Content	The objective of this course is to provide the basics of data structures and data organization. The course will introduce C/C++ and algorithms for the implementation of data structures which are stack, queue, linked list, and tree. Also, the applications of data structures cover stack applications which are parenthesis checker, infix to postfix and prefix conversions, recursion, dynamic stack and queue, and tree traversals. Theoretical aspects of the most widely used data structures will be covered during the lectures. Programming assignments and lab works cover the C/C++ implementations of applications of data structures that are discussed in the lectures.					
ELEE211	DIGITAL LOGIC DESIGN	(3, 0, 2)4	6	AC	-	English
Course Content	This course presents the basic tools for the design and analysis of digital circuits and provides methods and procedures suitable for a variety of digital design applications in computers, control systems, data communications, etc. The course introduces data representation in binary systems, complements, Boolean algebra, logic gates, truth tables, logic circuits, timing diagrams, De Morgan's law, algebraic manipulation, minterms and maxterms, Sum of Products (SOP) and Product of Sums (POS) forms, Boolean function simplification tools and Karnough Map method, NAND and NOR implementations, don't care conditions, combinational circuit design and analysis procedures, and design of Adders, Subtracters and Code Converters.					
ELEE231	CIRCUIT THEORY I	(3, 0, 2)4	6	AC	MATH124, PHYS122	English

Course Content	The course provides students with fundamental Concepts of Circuit Theory: Current, Voltage, Power and Energy as well as Definitions of Circuit Componentes: Voltage Current Sources; Resistors and Ohm's Law. Computation of Power over a Resistor, Set Up Circuit Model. Kirchhoff's Current and Voltage Laws. Resistors in Series and Parallel Configuration; Voltage and Current-Divider Circuits. Ampermeter, Voltmeter and Ohmmeter Circuits. Wheatstone Bridge, Triangle-Star Transformation. Loop Currents and Node Voltages Techniques, Source Transformation. Linearity and superposition principles, source transformations. Thevenin's and Norton's Theorems, Maximum Power Transfer, Graf Theory. Inductance and capacitance. The natural and forced response of the first – order (RL and RC) circuits. Natural and step responses of second-order RLC circuits.					
MATH225	**DIFFERENTIAL EQUATIONS**	(4, 0, 0)4	5	FC	MATH121, MATH124	English
Course Content	In this course, the ordinary differential equations and their applications will be considered. The course will demonstrate the usefulness of ordinary differential equations for modeling physical and engineering problems. Complementary mathematical approaches for their solution will be presented, including analytical methods. The basic content of the course includes first-order ordinary differential equations and their types of exact, separable, Bernoulli, first order, homogeneous ordinary differential equations, linear independence of the solutions, higher-order ordinary differential equations, and their solutions. The undetermined coefficient methods, the variation of the parameter method, Cauchy-Euler equations. The definition of the Laplace transform and some important applications of the Laplace transform will be included in this lecture.					
CMPE216	**OBJECT ORIENTED PROGRAMMING**	(2, 0, 2)3	6	AC	ENGR104	English
Course Content	This course introduces the concepts of object-oriented programming to students with a background in the procedural paradigm. The course begins with a brief review of control structures and data types with emphasis on structured data types and array processing. It then moves on to introduce the object-oriented programming paradigm, focusing on the definition and use of classes along with the fundamentals of object-oriented design. Other topics include an overview of programming language principles, simple analysis of algorithms, basic searching and sorting techniques, memory management, an introduction to software engineering issues, and ethics in software development.					
CMPE232	**OPERATING SYSTEMS**	(3, 0, 0)3	6	AC	ENGR104	English
Course Content	This course is an introduction to the basic concepts of operating systems, with both theoretical and practical issues being considered. Upon completion of the course, the student should understand the fundamental concepts and issues involved in operating system design and know about the basic services provided by operating systems in general. Topics include process description and control, deadlock, process scheduling, threads, SMP, partitioning, paging, segmentation, memory management algorithms, disk scheduling, and file systems. In addition to theory and concepts, specific implementation-related information is covered using the Linux Operating System.					
CMPE252	**ANALYSIS OF ALGORITHMS**	(3, 0, 2)4	6	AC	CMPE215	English
Course Content	The primary goal of this course is to introduce students to algorithm analysis and design in order to improve their analytical thinking skills. The emphasis of the course is on algorithms and problem-solving techniques. Runtime analysis, complexity analysis of sorting and searching algorithms, divide and conquer algorithms, dynamic programming, greedy algorithms, graph algorithms, and string matching algorithms are all important concepts. A variety of problem-solving paradigms will be applied to demonstrate creative and effective approaches to a particular challenge. In each scenario, emphasis will be given to categorically demonstrating the algorithm's soundness. Upon completion, the students will be able to demonstrate how effective the algorithm is in comparison to simple					
ENGR215	**RESEARCH METHODS FOR ENGINEERING AND ARCHITECTURE**	(2, 0, 0)2	3	FC	-	English
Course Content	The aim of this course is to develop students' knowledge and understanding of the role and conduct of quantitative and qualitative research methods in engineering. The imperative for ethical research practice will be presented. The course equips students with the skills to review and conduct methodologically sound research as a part of their professional work. Students develop the skills to recognize and reflect on the strengths and limitations of different research methodologies, understand the links between theory and practice, critically assess research, and address ethical and practical issues. The course takes a step-by-step approach to the design and implementation of quantitative and qualitative techniques including case study and precedent studies, surveys, interviews, focus groups, participant observation, textual and media analysis.					
STAT226	**PROBABILITY AND STATISTICS**	(3, 1, 0)3	6	FC	MATH121	English
Course Content	The objective of this course is to introduce basic probability and statistics concepts. The focus of this course is on both applications and theory. Topics include: introduction to random variables, simple data analysis and descriptive statistics, frequency distribution, cumulative distribution, sample space, events, counting sample points (basic combinatorics), probability of an event, probability axioms, laws of probability, conditional probability, Bayes' rule, discrete and continuous random variables, probability distributions, cumulative probability distributions, discrete and continuous probability distributions, discrete uniform, Binomial, Geometric, Hypergeometric, Poisson, Continuous uniform, Normal Disributions, Gamma and Exponential distribution, jointly distributed random variables, expectation and covariance of discrete and continuous random variables, random sampling, sampling distributions, distribution of Sample Mean, Central Limit Theorem(CLT).					

CMPE321	MICROPROCESSORS	(3, 0, 2)4	6	AC	ELEE211	English
Course Content	The Microprocessors course covers the main components and working principles of microprocessors, focusing on the Intel 80x86 family architecture. Topics include memory organization, assembly programming, and debugging. Students will develop programs for arithmetic, BCD, ASCII operations, and perform input/output device programming. They will learn to handle keyboard input, display characters or strings on the screen, and convert data to ASCII, packed BCD, and unpacked BCD formats. The course also explores properties and interfacing of parallel and serial ports, and designing microprocessor-based systems, using the real-world example of the 80x86 IBM PC. By the end of the course, students will have essential skills to work with microprocessors and develop practical					
CMPE341	DATABASE SYSTEMS	(3, 0, 2)4	5	AC	CMPE215	English
Course Content	This is a database management system introduction course. The lectures' primary goal is to show students how to conceptually model data and then implement that model in SQL. The focus of the lectures is on practical aspects of data modeling, including normalization and the creation of entity connection diagrams. Oracle is used in the labs to teach SQL. The purpose of lab work is to thoroughly introduce SQL and, in particular, the SQL data manipulation language statement. The learner will be able to create databases for use in industry after completing this course.					
SFWE343	SOFTWARE ANALYSIS AND DESIGN	(2, 0, 2)3	5	AC	CMPE216	English
Course Content	The aim of this course is to introduce some fundamental principles of the software engineering discipline and illustrate the application of those principles in the context of a real-life project. Main topics covered are software process models, rapid software development and prototyping, agile software development, Initial design, modularity, structure charts, partitioning using UML, database design, software metrics, risk analysis and management, testing and quality assurance, software estimation techniques, software quality, and configuration management. Upon completion of this course, the students analytical skills will be enhanced. Meanwhile, they will learn how to understand the customer's language and how to explore the customer's goals in context.					
SFWE315	VISUAL PROGRAMMING	(2, 0, 2)3	5	AC	CMPE216	English
Course Content	This course introduces computer programming using the Visual Programming Language with object-oriented programming principles. The emphasis is on event-driven programming methods, including creating and manipulating objects and classes and using object-oriented tools such as the class debugger. Visual programming languages are widely used for the rapid development of graphical applications. This subject will introduce students to the fundamental principles of event-driven programming and to programming in a visual environment through the use of the Visual C# programming language. An additional aim of this subject is to give students an understanding of the main ideas of human-computer Interaction (HCI). Upon completion, students should be able to design, code, test, and debug at a beginning level.					
SFWE344	SOFTWARE PROJECT MANAGEMENT	(2, 0, 1)2	4	AC	SFWE343	English
Course Content	This course introduces students to the fundamental principles of software engineering with a specific focus on software project management. It covers the full software development lifecycle (SDLC) including planning, analysis, design, implementation, testing, and maintenance. Students learn about various software process models, such as Waterfall, Agile, Rapid Prototyping, and iterative development, and gain practical insights into applying these models in real-world projects.					
SFWE415	SOFTWARE ARCHITECTURE	(3, 0, 1)3	6	AC	SFWE343	English
Course Content	The objective of this course is to generate dependable, safe, and effective software products by focusing on software product development. This involves looking at the general organization of the software's development and release phases, how the software is broken down into components, how the servers are organized, and the technologies that were utilized to create the software. With a focus on the practical concerns inherent in software project management, students will master the fundamentals of software architectural designs, patterns, and views. In addition, a brief introduction to microservices architecture and cloud-based applications will be covered.					
MATH328	NUMERICAL ANALYSIS	(3, 1, 0)3	6	FC	MATH124, MATH225	English
Course Content	In this course students will learn how to solve mathematical problems numerically, which cannot be solved analytically. The course content will includes following topics: Approximate calculation and error concept, Convergence, stability, error analysis and conditioning. Solving systems of linear equations: The LU and Cholosky factorization, pivoting, error analysis in Gaussian elimination. Matrix eigenvalue problem, power method, orthogonal factorizations and least squares problems. Solutions of nonlinear equations. Bisection, Newton`s, secant and fixed point iteration methods. Approximate root finding methods: sequential repeating method, sloping method, Newton-Raphson method, Bairstow method. Numeric integration methods. Finite differences. Numeric derivatives. Euler					
SFWE403	SUMMER TRAINING	(0, 0, 0)0	2	AC	-	English
Course Content	Engineering summer training is a 30-day internship for engineering students to apply theoretical knowledge from their Bachelor's studies in a professional setting. The training can take place in any institution related to Software Engineering. Students work on real-life tasks, interact with professionals, and explore their interests within the industry. After the third year of their studies, they write summer training reports summarizing their experiences. A committee evaluates these reports to assess the students' internship performance. The training aims to bridge the gap between academia and industry, enabling students to better prepare for future career opportunities and make informed decisions about their professional path.					
SFWE411	SOFTWARE VALIDATION & TESTING	(3, 0, 1)3	6	AC	SFWE343	English
Course Content	The goal of this course is to teach students about software validation and testing concepts and theories. It is primarily concerned with examining whether a software system meets specifications and requirements so that it fulfills its intended purpose. White box, black box, integration, system and acceptance, performance, regression, object-oriented, usability, and accessibility testing will be covered. Students who successfully complete the course will be aware of a wide range of software testing techniques and have the ability to apply the right techniques in the process of software validation and testing.					
ENGR401	ENGINEERING DESIGN I	(1, 2, 0)2	6	FC	-	English
Course Content	Engineering Design is a crucial activity for engineering students, involving various phases of the design process. Students work in teams under supervision to complete interdisciplinary capstone projects over one academic year, spanning ENGR401 and ENGR402 courses. ENGR401 covers problem formulation, technical surveys, detailed problem study, analysis, and methodical initial solution formulation. The course requires comprehensive preliminary design documentation for solving a realistic and complex software engineering problem, applying skills gained throughout the undergraduate program. Students present progress through reports and presentations during the semester and at its conclusion. This extended exercise aims to cultivate professional application and experience in engineering design.					
ENGR402	ENGINEERING DESIGN II	(0, 4, 2)3	10	FC	ENGR401	English
Course Content	This course is the sequel to ENGR401. It consists of the implementation of a realistic, preferably interdisciplinary, engineering capstone design project emphasizing engineering design principles on an electrical and electronic engineering topic. It is carried out by a team of students under the supervision of an instructor. The team must complete the detailed design and implementation of the preliminary design they started in the ENGR401 course. It is an extended exercise in the professional application of the knowledge, experience and skills gained in the undergraduate program. The team has to complete analysis, design, implementation, testing and documentation of a proto-type or actual engineered product, present it and submit a final report in the technical project report					
ENGR404	ENGINEERING ATTRIBUTES AND ETHICS	(2, 0, 2)2	3	FC	-	English
Course Content	Engineering Attributes and Ethics is a final year course which aims to provide knowledge and awareness of a number of important engineering issues. The knowledge areas include but are not limited to: professionalism, ethics, project management, sustainable development, risk management, change management, standards, health, environment, hazards, workplace health and security, societal issues as well as contemporary issues reflecting on the applications of the engineering profession. Awareness areas include but are not limited to entrepreneurship, innovation and the legal ramifications of the engineering solutions.					
OHSA206	OCCUPATIONAL SAFETY AND HEALTH MANAGEMENT	(3, 0, 0)3	3	FC	-	English
Course Content	This course provides engineering students with a comprehensive understanding of occupational safety and health management principles in various industries. Topics covered include the development of safety and health functions, hazard avoidance concepts, the impact of regulations, handling toxic substances, environmental control, noise, explosive materials, fire protection, personal protection, and first aid. By the end of the course, students will be equipped with the knowledge and skills to create safe working environments, implement safety measures, and effectively manage occupational safety and health concerns in professional settings.					

Course Descriptions – III: All Area Elective and Faculty/School Elective courses offered by the department of the program.

Course Code	Course Title	Credit	Credit	Catego.	Pre-requisite	Teaching Language

SFWE316	**INTERNET AND WEB PROGRAMMING**	(2, 0 ,2)3	6	AE	CMPE216	English
Course Content	This course is an introduction to programming for the World Wide Web. Students will learn about the relationship between clients and servers, how the internet works, and how web pages are constructed using several technologies. The following topics will be covered: HyperText Markup Language (HTML) for authoring web pages; Cascading Style Sheets (CSS) for applying stylistic information to web pages; JavaScript (JS) for creating interactive web pages; Asynchronous JavaScript and XML (Ajax) for enhanced web interaction and applications; PHP web services for handling and responding to web service requests; and Structured Query Language (SQL) for interacting with databases. After successfully completing this course, a student should be able to Support the development of web					
SFWE434	**CRYPTOGRAPHY**	(3, 0 ,0)3	6	AE		English
Course Content	Introduction to Cryptology, Symmetric Cryptography, Cryptanalysis, Modular Arithmetic and More Historical Ciphers, Stream Ciphers, Random Numbers and an Unbreakable Stream Cipher, Shift Register-Based Stream Ciphers, The Data Encryption Standard (DES) and Alternatives, Overview of the DES Algorithm, Internal Structure of DES, Decryption, Security of DES, Implementation in Software and Hardware, DES Alternatives, The Advanced Encryption Standard (AES), Overview of the AES Algorithm, Some Mathematics: A Brief Introduction to Galois Fields, Internal Structure of AES, Decryption, More About Block Ciphers, Introduction to Public-Key Cryptography, The RSA Cryptosystem.					
SFWE431	**HUMAN COMPUTER INTERACTION**	(3, 0 ,0)3	6	AE		English
Course Content	The goal of this course is to teach students about human-computer interaction concepts and theories. It is primarily concerned with how humans perceive and interact with computers, cognitive principles, design, evaluation, user experience, direct manipulation and immersive environments, fluid navigation, experessive humman and command languages, advancing user experience, timely user experience, documentation and data visualization.					
SFWE412	**SOFTWARE QUALITY ASSURANCE**	(3, 0 ,0)3	6	AE		English
Course Content	Software Quality Assurance (SQA) is a critical aspect of software development that ensures the final product meets the desired standards and specifications. This course will provide students with an understanding of the principles and techniques used in SQA. Software quality assurance issues are discussed in general terms; however, the course concentrates on practical issues related to testing large software packages. Test case design, the testing plan, and test management are issues that are handled in more detail.					
SFWE422	**MOBILE APPLICATION DEVELOPMENT**	(3, 0 ,0)3	6	AE		English
Course Content	This course provides a comprehensive study of the principles, architectures, and technologies used in the development of mobile applications. It covers mobile platform architectures, application lifecycle management, user interface and user experience design for mobile environments, and event-driven programming models. The course introduces native and cross-platform development frameworks, mobile operating systems, and integration with device hardware and sensors. Topics also include data storage, networking, security, performance optimization, and deployment of mobile applications. Emphasis is placed on designing efficient, scalable, and user-centered mobile solutions. Prerequisites include knowledge of programming fundamentals, object-oriented programming, and basic software engineering concepts. Through lectures, hands-on laboratory sessions, and project-based development, students will gain practical skills in building and deploying functional mobile applications for modern mobile platforms.					
SFWE441	**ADVANCE DATABASE**	(3, 0 ,0)3	6	AE		English
Course Content	This course provides an in-depth study of advanced database concepts, architectures, and technologies beyond traditional relational database systems. It covers topics such as advanced SQL and query optimization, transaction management and concurrency control, recovery techniques, and database security. The course also introduces distributed and parallel databases, NoSQL and NewSQL systems, data warehousing, OLAP, and big data storage models. Emphasis is placed on database design for scalability, reliability, and performance, as well as on the evaluation of modern database management systems. Prerequisites include foundational knowledge of database systems, data modeling, and SQL. Through lectures, laboratory sessions, and project-based work, students will develop the technical skills required to design, implement, and manage advanced database solutions for complex and large-scale applications.					
SFWE442	**OBJECT-ORIENTED PROGRAMMING LANGUAGE AND SYSTEMS**	(3, 0 ,0)3	6	AE		English
Course Content	This course provides an in-depth study of object-oriented programming concepts and the design of object-oriented software systems. It covers fundamental principles such as abstraction, encapsulation, inheritance, and polymorphism, along with advanced topics including object-oriented analysis and design, class hierarchies, interfaces, design patterns, and exception handling. The course also examines the structure and features of modern object-oriented programming languages and runtime systems, including memory management, type systems, and modularity. Emphasis is placed on writing reusable, maintainable, and extensible software through sound object-oriented design practices. Prerequisites include prior knowledge of programming and data structures. Through lectures, laboratory exercises, and programming projects, students will develop both theoretical understanding and practical skills necessary for designing and implementing robust object-oriented software systems.					
SFWE445	**RAPID APPLICATION DEVELOPMENT**	(3, 0 ,0)3	6	AE		English
Course Content	This course focuses on the principles, methodologies, and tools used for the rapid design, development, and deployment of software applications. It emphasizes iterative and incremental development, prototyping, and user-centered design to reduce development time while maintaining software quality. Topics include rapid development frameworks, low-code and no-code platforms, component-based development, reusable software components, and agile practices. The course also addresses requirements elicitation in fast-paced environments, rapid prototyping techniques, testing and validation strategies, and deployment considerations. Emphasis is placed on productivity, maintainability, and alignment with user requirements. Prerequisites include knowledge of programming fundamentals, software engineering principles, and basic database concepts. Through lectures, hands-on labs, and project-based activities, students will gain practical experience in developing functional software applications within compressed development cycles.					
SFWE451	**INFORMATION RETRIEVAL**	(3, 0 ,0)3	6	AE		English
Course Content	This course provides a rigorous introduction to the principles, models, and techniques used in information retrieval systems. It focuses on the representation, storage, organization, and retrieval of unstructured and semi-structured data, particularly text-based information. Topics include text preprocessing, indexing structures, inverted files, retrieval models (Boolean, vector space, and probabilistic models), relevance ranking, similarity measures, and evaluation metrics for retrieval effectiveness. The course also introduces web search technologies, query processing, relevance feedback, and basic concepts of text mining and natural language processing. Emphasis is placed on algorithmic design, system efficiency, and scalability. Prerequisites include knowledge of data structures, algorithms, probability, and basic database systems. Through lectures, laboratory exercises, and project work, students will gain the technical competence required to design and evaluate modern information retrieval systems.					
SFWE467	**DATA MINING**	(3, 0 ,0)3	6	AE		English
Course Content	This course introduces the theoretical foundations and practical methodologies of data mining, with a focus on discovering meaningful patterns and knowledge from large datasets. It covers key topics such as data preprocessing, data cleaning, feature selection, and dimensionality reduction, followed by core data mining techniques including classification, clustering, association rule mining, and anomaly detection. The course also introduces basic machine learning concepts and evaluates model performance using appropriate metrics. Emphasis is placed on algorithmic understanding, scalability, and the application of data mining methods to real-world problems. Prerequisites for this course include knowledge of programming, probability, statistics, and database fundamentals. Through lectures, hands-on laboratories, and project-based assignments, students will develop the analytical and practical skills required to apply data mining techniques effectively in diverse application domains.					
SFWE472	**COMPUTER GRAPHICS**	(3, 0 ,0)3	6	AE		English
Course Content	This course provides a comprehensive introduction to the theoretical foundations and practical techniques of computer graphics. It covers the mathematical and algorithmic principles underlying the generation, representation, and manipulation of visual content. Topics include geometric modeling, coordinate systems and transformations, viewing and projection, rasterization algorithms, color models, illumination and shading techniques, texture mapping, and basic animation concepts. The course also introduces graphics pipelines and hardware acceleration concepts used in modern graphics systems. Emphasis is placed on both 2D and 3D graphics, with attention to computational efficiency and visual realism. Prerequisites for this course include knowledge of linear algebra, basic calculus, and programming fundamentals. Through lectures, laboratory sessions, and programming assignments, students will develop the technical skills required to design and implement graphical applications and understand the principles behind modern visualization systems.					
SFWE474	**INTRODUCTION TO PARALLEL COMPUTING**	(3, 0 ,0)3	6	AE		English

Course Content	This course introduces the fundamental concepts and principles of parallel computing, focusing on the design and implementation of programs that execute efficiently on multi-core and distributed systems. Students will learn about parallel architectures, concurrency models, parallel algorithms, and performance evaluation techniques. The course covers shared-memory and distributed-memory paradigms, including basic concepts such as threads, processes, synchronization, and communication. Emphasis is placed on understanding how parallelism can be used to improve computational performance and scalability. Prerequisites for this course include basic knowledge of programming and data structures. Through lectures, practical exercises, and laboratory work, students will develop the foundational skills necessary to analyze, design, and implement parallel applications.

SFWE475	**ADVANCED WEB PROGRAMMING**	(3, 0 ,0)3	6	AE	CMPE216	English
Course Content	This course provides an in-depth exploration of advanced web development technologies, including jQuery, Bootstrap, React.js, and Node.js. Students will learn to create dynamic, responsive, and interactive web applications by applying these frameworks and libraries. Emphasis will be placed on both frontend and backend development, incorporating best practices and design patterns. Prerequisites for this course include foundational knowledge of HTML, CSS, PHP, and JavaScript. Through lectures, hands-on labs, and project work, students will gain practical skills and theoretical understanding essential for modern web programming.					

Course Descriptions – IV: All Area Elective and Faculty/School Elective courses offered by other academic units.

Course Code	Course Title	Credit	ECTS Credit	Course Catego.	Pre-requisite	Teaching Language
CHEM121	**CHEMISTRY**	(2, 1, 2)3	5	FE		English
Course Content	In this course, students will learn types of matter, measurements, properties of substances; atoms and atomic theory, components of the atom, introduction to the periodic table, molecules and ions, formulas of ionic compounds, names of ionic compounds; atomic masses, the mole, mass relations in chemical formulas, mass relations in reactions; measurements on gases, the ideal gas law, gas law calculations, psychometric of gaseous reactions, gas mixtures: Partial pressures and atomic spectra, the hydrogen atom, quantum numbers, atomic orbitals; shape and sizes; electron configurations in atoms, orbital diagrams of atoms; the polarity of molecules; principles of heat flow, measurements of heat flow, calorimetry, enthalpy, thermochemical equations, enthalpies of formation, the first law of thermodynamics, liquids and solids.					
MATH228	**ENGINEERING MATHEMATICS**	(3, 1, 0)3	6	FE	MATH124, MATH122	English
Course Content	Engineering Mathematics gives students an introduction to the theory of functions of a complex variable, a fundamental area of mathematics. Topics include complex numbers and their properties, algebra of complex numbers. polar representation. complex functions. limits and continuity. analyticity and analytic functions. analytic functions and the Cauchy-Riemann equations, the logarithm and other elementary functions of a complex variable, integration of complex functions, the Cauchy integral theorem and its consequences, power series representation of analytic functions, the residue theorem and applications to definite integrals.					
ELEE341	**ELECTRONICS-I**	(3, 0, 2)4	5	FE	ELEE231	English
Course Content	Operational amplifiers: common mode and difference mode process. Op-amp applications: voltage adder, voltage follower, differential amplifier, derivate and integrator circuits, active filter design. Semiconductor elements and diodes. Diode equivalent circuits. LEDs and zener diodes. Load line analysis. Half-wave and full-wave rectifier circuits. Bipolar junction transistor: Operation limits of transistors, testing and electrical specifications. DC biasing of transistors: Determining of operation point, voltage divider biasing, voltage feedback biasing and other biasing types. Transistor switching circuits. PNP transistors and stability of biasing. Characteristic of field effect transistors. Depletion-type MOSFETs, Enhancement-type MOSFETs, VMOS and CMOSs. Biasing of field effect transistors. Self-biasing and voltage divider biasing. Biasing of depletion-type MOSFETs and enhancement-type MOSFETs. Other two gates: Varactor, power diodes, tunnel diode, photodiode.					
ELEE331	**SIGNALS AND SYSTEMS**	(3, 0,2)4	5	FE	-	English
Course Content	Classification of Signals and Basic Signal Properties. Time Domain Models of Linear Time Invariant (LTI) Systems: Continuous time systems. Causal LTI systems described by differential equations. System block diagrams. The solutions of differential equations. The unit impulse response and convolution integral. State variable analysis of LTI systems. Discrete time systems. The unit sample response and discrete convolution. Fourier series and Fourier transform representation of continuous-time and discrete- time periodic signals. Time and frequency characterization of signals and systems. Z-transform and inverse z-transform. Region of convergence of the z-transform. z-domain analysis of discrete LTI systems. LTI Systems With Random Inputs. Definition of Random variables, stochastic process, first and second order statistics, moment, correlation and co-variance, stationary process, ergodicity.					
ELEE362	**COMMUNICATION SYSTEMS**	(3, 0,0)3	5	FE	ELEE331	English
Course Content	Review of Fourier transform and its properties. Transmission of signals through linear systems. Power spectral density and autocorrelation function. The sampling theorem and the Nyquist rate, aliasing distortion. Non-ideal sampling: Pulse amplitude modulation (PAM) and flat-top PAM and equalization. Digital signaling: quantization, encoding and pulse code modulation (PCM), line codes and their spectra, regenerative repeaters. Pulse transmission: Intersymbol interference (ISI), Nyquist method for zero ISI, time division multiplexing (TDM), pulse-time modulation techniques. Complex envelope representation of bandpass and modulated signals. RF circuits: limiters, converters, multipliers, detectors, PLL circuits and etc. Analog modulation techniques: AM, DSB-SC, SSB etc. Binary modulation techniques: ASK, BPSK, FSK.					
ELEE431	**DIGITAL SIGNAL PROCESSING**	(3, 0, 0)3	6	FE	ELEE331	English
Course Content	This course includes frequency-domain representation of the discrete-time signal, Fourier Transform and its properties, Evaluation of the Z-Transform, Properties of ROC for the Z-Transform, Properties of the Z-Transform, Frequency and Time Domain, Representation of Sampling Reconstruction of Band-limited Signals, Nyquist Theory, Aliasing Decimation, Interpolation, Transform analysis of LTI system, Stability, Causality, Inverse systems, Minimum Phase, maximum phase, mixed-phase systems, all pass systems, Relationship between magnitude and phase, Digital Filter Design, Finite Impulse Response (FIR) Filters, Infinite Impulse Response (IIR) Filters and Filters Designs.					
CMPE431	**ADVANCED COMPUTER NETWORKS**	(3, 0 ,0)3	6	FE	-	English
Course Content	This course focuses on advanced topics in the most cutting-edge wired networking technology, with a focus on networking applications and an introduction to the most recent research fields. Give a thorough introduction to a variety of subjects in the study of computer networks, such as the Internet. The most significant protocols now in use are used to illustrate how networks actually function, as opposed to describing how networks operate in abstract protocols. Network protocols, Internet routing, peer-to-peer networks, network security, traffic control, error detection and correction, and internetworking are among the subjects covered. This enables the conversation to include real-world experiences.					
CMPE432	**WIRELESS COMMUNICATION NETWORKS**	(3, 0 ,0)3	6	FE	-	English
Course Content	This course is an introduction to the design, analysis, and fundamental limits of wireless transmission systems. Topics to be covered include wireless channel and system models; fading and diversity; resource management and power control; multiple-antenna and MIMO systems; space-time codes and decoding algorithms; multiple-access techniques and multiuser detection; broadcast codes and precoding; cellular and ad-hoc network topologies; OFDM and ultra-wideband systems; and architectural issues. Radio propagation effects, coverage and statistical channel modeling, time-varying channels, fading effects, various bandpass modulation schemes and detection systems, channel capacity, spread spectrum communications, diversity, and combining in cellular systems.					
CMPE433	**WIRELESS SENSOR NETWORKS**	(3, 0 ,0)3	6	FE	-	English
Course Content	This course offers an introduction to Wireless Sensor Networks (WSN) while exploring the latest topics in the field. The primary goal is to provide an overview of fundamental WSN problems and examine existing solutions. Topics covered include data aggregation, information dissemination, security, power management, localization, topology control, routing, naming, and collaborative signal and information processing for target tracking. Students will work on labs involving Ubiquitous Computing applications, implementing them on Micaz motes with Tinyos, a lightweight event-driven operating system. The course will draw heavily from recent research work in wireless sensor networks, allowing students to gain insights into cutting-edge developments in this rapidly evolving domain.					
CMPE461	**COMPUTING SYSTEMS**	(3, 0 ,0)3	6	FE	-	English
Course Content	This course explores modern computer systems, focusing on abstraction layers and communication mechanisms. The top layer is the operating system, which ensures smooth and safe operation of applications. The next part explores network communication, data transportation, and circuits underlying computer systems. The final part focuses on the physical underpinnings of computers, including transistors processing information. While the course focuses on digital computer systems, students can also study analog or biological computing systems if they align with the course's learning goals.					

CMPE463	**CLOUD COMPUTING**	(3, 0 ,0)3	6	FE	-	English
Course Content	This course focuses on the use of the most popular cloud computing applications and services that run on a distributed network using virtualized resources and are accessed by common Internet protocols and networking standards. Its architecture, abstraction, virtualization, infrastructure, scaling deployments, machine learning in the cloud, data management, security, and privacy in the cloud will be discussed in detail. On successful completion of this course, students should be able to: Explain Cloud Computing abstraction and virtualization; Describe cloud storage services, pros and cons; Use different cloud storage services; Work with cloud APIs and SDKs; Describe machine learning in the cloud; Secure data in the cloud; and Build their own cloud with open stack.					
CMPE464	**ARTIFICIAL INTELLIGENCE**	(3, 0 ,0)3	6	FE	-	English
Course Content	This course teaches students the fundamentals of artificial intelligence's knowledge representation, problem solving, and learning methodologies. Definitions of AI from many perspectives, intelligent agents and agent architectures, rational intelligent agents, how agents should act, and intelligent agent environments will be taught. Students should be able to: develop intelligent systems by assembling solutions to concrete computational problems; comprehend the role of knowledge representation, problem solving, and learning in intelligent-system engineering; and recognize the role of problem solving, vision, and language in understanding human intelligence from a computational standpoint.					

CMPE465	**NEURAL NETWORKS**	(3, 0 ,0)3	6	FE	-	English
Course Content	This course serves as an introduction to neural networks, covering both theoretical and applied topics. After completing this course, the student should be able to apply neural networks to actual classification issues and comprehend the key neural network structures and learning algorithms. Associative memory networks, discrete hopfield networks, radial basis function networks, and self-organizing networks are some of the subjects discussed. Single-layer perceptions and multi-layer perceptions are also covered. Students who successfully complete this course should be able to: define a neural network; Describe the differences and similarities between rudimentary artificial neural network models and real brains. Describe the key elements that neural network systems should consider to achieve effective learning and generalization performance.					
CMPE322	**DATA COMMUNICATION AND COMPUTER NETWORKS**	(3, 0 ,2)4	5	FE	CMPE215	English
Course Content	This course will cover the principals of data communications; information transfer, computer networks and their applications. Network structures, architectures and protocols. Openb systems and the ISO-OSI reference model; services and network standardization. Communcation systems: transmission media, analog and digital transmission, PSTN, modems, PCM, encoding and digital interface. Thransmission and switching: FDM, TDM, modulation, circuit, packet and message switching. The store and forward concept. Networking characteristics. Storage, delay multiplexing, bandwidth sharing and dynamic bandwidth management, QoS. Channel organization, framing, channel access control. PSPDN and integrated digital network concept: ISDN. LANs, MANs and WANs. ATM and gigabit networking. Communication models. De-facto standards. The Internet open architecture and the protocol suite. Moden applications of networking. Keywords: FDM, TDM, ISDN					
CMPE466	**EXPERT SYSTEMS**	(3, 0 ,0)4	6	FE	-	English
Course Content	This course introduces intelligent agent principles, searching, knowledge and reasoning, planning, learning, and expert systems. Students will discover how theory and application complement each other in this course. Theory and application are both presented. Students will be introduced to problem-oriented languages, which they can use to create their own expert systems. Students will obtain an understanding of the role of expert systems in today's society by merging theory with a fully functional way of applying that theory to real-world problems.					
AINE301	**BASIC SEARCH METHODS**	(3, 0 ,0)3	5	FE	MATH124, AINE201	English
Course Content	The major objectives of this course are:1) To establish the concept of equilibrium. 2) To introduce the concept of structural analysis with reference to statically determinate trusses and beams. 3) To introduce properties of surfaces used in mechanics. The topics included in this course are Introduction to rigid body mechanics. Equivalent force systems: Concepts of moment, couple, resultant. Equilibrium: Free-body diagram; equations of equilibrium. Structural analysis: Trusses; beams. Shear force and bending moment diagrams by the method of sections and by the method of integration. Properties of surfaces: Area moment and centroid; moments and product of inertia; principal directions.
